

Aiven MySQL + Navicat Premium Lite on Windows

Part 1 — Install Navicat Premium Lite

Step 1: Download Navicat Premium Lite

Go to the official Navicat download page:

[Download Navicat Premium Lite for Windows](#)

Choose:

Windows → 64-bit

The current free version is **Navicat Premium Lite 17**. Navicat lists Premium Lite as a free download, with a maximum of 5 users per organization.

Install it normally:

Next

→ I Agree

→ Next

→ Install

→ Finish

Part 2 — Create Aiven MySQL

If you already have an Aiven MySQL service, skip to Part 3.

Step 2: Open Aiven

Go to:

[Aiven Console](#)

Log in.

Step 3: Create a project

Create a project, for example:

LavaLust Project

Step 4: Create MySQL

Go to:

Services → Create service

Select:

MySQL

Choose the available **Free** plan if you're using it for learning/development.

Aiven's current documentation confirms that you create the service by selecting MySQL, choosing the available service tier/plan, and creating the service.

Wait until:

Status: Running

Part 3 — Get the Aiven MySQL Credentials

Step 5: Open your MySQL service

Click your MySQL service.

You should be on the **Overview** page.

Part 4 — Download the Aiven SSL Certificate

This is an important step.

Aiven uses TLS to protect connections to its services.

Step 6: Find CA Certificate

In your Aiven MySQL service:

Overview → Connection information

Look for:

CA Certificate

Click **Download**

Save it somewhere easy to find.

Part 5 — Create the Navicat Connection

Step 7: Open Navicat Premium Lite

Open:

Navicat Premium Lite 17

You should see the main Navicat window.

Step 8: Create a MySQL connection

Click:

Connection

then:

MySQL

You should get a connection window.

Part 6 — Enter the Aiven Details

Enter the information from Aiven.

Connection Name

You can use:

Aiven MySQL

Host

Copy the **Host** from Aiven:

mysql-xxxxx.aivencloud.com

Port

Copy the Aiven port:

12345

User Name

Usually:

avnadmin

Password

Enter your Aiven password.

So your Navicat settings should look approximately like:

Connection Name: Aiven MySQL

Host: mysql-xxxxx.aivencloud.com

Port: 12345

User Name: avnadmin

Password: *****

Do not use localhost.

Also don't automatically use port 3306. Aiven gives each service its own connection port.

Part 7 — Configure SSL

Now go to the **SSL** section/tab in the Navicat connection window. Check enabled.

If Navicat shows:

Client Certificate and Client Key. **Leave these empty** unless Aiven specifically provides/requires them for your connection.

For the normal Aiven MySQL username/password connection, the important item is the **CA certificate**. Upload only the CA Certificate and check Verify server certificate against CS

Part 8 — Test the Connection

At the bottom of the connection window, click:

Test Connection

If everything is correct, you should get a success message.
